IDENTIFIERS *Oklahoma

ABSTRACT

The purpose of the mobility study was to determine what number and percentage of secondary, postsecondary, and full-time adult graduates of vocational-technical programs in Oklahoma find or seek employment in the same geographic region of their graduation. It was also determined what number and percentage of graduates leave the region to seek employment in each of the 11 sub-State planning regions. The results of the study are indicated in maps presented in numerical order by occupational objectives. For each of the 88 occupational objectives, a 'trained and working' map indicates the percentage of total number of graduates trained in the region and the percentage of total graduates working in other States. The 'mobility' maps, expressed in statewide percentages, show direction and level of geographic mobility and indicate the percentage of the total graduates' migration. Out-of-State migration is similarly reported, except that the migration path is drawn to the nearest State border rather than State destination. In 24 of the 88 occupational objectives, a significant difference was found between the distribution of trainees to the 11 sub-State planning regions and the distribution of graduates to the 11 sub-State planning regions.

A MOBILITY STUDY

Introduction

This study measured the geographic mobility of 1973-74 graduates of vocational, technical programs in Oklahoma. Geographic mobility is physical movement of graduates from training site to employment site. A brief introductory review of selected research in mobility provides a background for consideration of this study.

Two previous studies similar to this have been conducted in Oklahoma. They are the "Three Year Follow up" by the Oklahoma Research Coordinating Unit (1967) and a 1970 Oklahoma State University thesis "Geographic Mobility of Trainees Leaving Vocational and Technical Education Programs in Oklahoma" by K. Bryn Whatley. The 1967 study, although comprehensive, did not use the sub-state planning regions. Mr. Whatley used the sub state planning regions but included graduates of private school programs. Each of these studies found significant migration, both within the state and to other states.

Jacob J. Kaufman and John M. Sumansky, in their publication, Manpower Planning, Occupational Education and Labor Mobility, describe persons who have a high tendency to move as being young, single or with no family attachments, and having no property ties. This is a very accurate description of a majority of the graduates included in the mobility study.

The United States Department of Commerce publication, Mobility of the Population of the United States, March 1969 to March 1970, revealed that 24.1 percent of persons eighteen or nineteen years of age relocated during the year. The same report showed that 41.8 percent of persons twenty through twenty-four years of age relocated during the year.

There are two other significant types of mobility which warrant mentioning here. occupational and industrial. Occupational mobility is a person's movement among various occupations during his lifetime. Occupational mobility is of concern because of the inclusion of graduates working in unrelated occupational areas (an area significantly different from that for which the student was trained). It is the philosophy of the Oklahoma State Department of Vocational and Technical Education that the trained graduate will maintain the same occupational objective, even though, at the time of reporting the graduate was not working in that occupation. Therefore, the effects of occupational mobility were minimized and did not upset the validity of this study.

Industrial mobility is a person's movement from industry to industry while remaining in the same occupational category. Generally, industrial mobility occurs when one industry is paying workers more than another industry. Industrial mobility is not relevant to this study because the graduates are trained for a specific occupation rather than an industry.

Problem

The Purpose

The purpose of the mobility study was to determine what number and percentage of secondary, post secondary, and full time adult graduates of vocational technical programs find employment or are seeking employment in the same geographic region of their graduation. It was also determined what number and percentage of graduates leave the region to seek employment in each of the eleven sub-state planning regions. Results of the study are reported by occupational objective and sub-state planning region.

Limitation

The reader should be cautioned not to try to read a specific destination into the inter regional migrations. The untested (by this study) assumption that migration paths lead to Tulsa and Oklahoma City is probably true, however, this study was concerned only with sub state planning regions. No attempt was made to define destination more specifically (Worker Commuting in Oklahoma, published by Oklahoma Employment Security Commission, June, 1974 analyzes worker commuting patterns by county and selected cities)

Definition of Terms

Full time Adult Program A program designed for individuals over sixteen who are attending a vocational technical program for a minimum of six hours per day

Post Secondary Program A program designed primarily for youths or adults who have completed or left high school and are available for an organized program of study in preparation for entering the labor market

Secondary Program A program designed for high school youth including grades nine through twelve

Procedure

The Population

The population consisted of all secondary, post secondary and full-time adult graduates of vocational technical programs in Oklahoma in 1973-74. This included vocational technical graduates of public secondary schools, area vocational-technical schools and public institutions of higher education. The population was limited by updated information provided by the Student Accounting System which isolated those graduates in the labor market as of October 1, 1974. This group included graduates in five classifications (1) working full time in occupation for which trained, (2) working full-time in related occupation, (3) working full time in unrelated occupation, (4) working part time (does not include those graduates attending school full time), and (5) not employed but actively seeking employment

The Base Sample

The original goal was to use the entire population as the sample. A list was prepared of the graduates from each of the programs. This list was then distributed to the teachers of the vocational technical programs. The teachers were requested to provide the present

location of each graduate on the list (The Parallel Follow up Study published in December, 1974 provides ample justification for the reliability of teacher input. The greatest point of disagreement found between the reports of the students and teachers was in the definition of related and unrelated occupations. The mobility study makes no attempt to discriminate along the related/unrelated line, therefore, the teacher is the most efficient and reliable source for this information.)

It was soon apparent that the rate of return was not going to be sufficient to provide a census (100%) sample. At this point, the decision was made to develop a random sample of the population.

A random sample was prepared independently, without observing the information previously collected, in order to protect the validity of the study. The list of graduates in each occupational objective was divided according to sub-state planning regions. The number trained in each region was then transferred to a table as illustrated below (Table I). From the column totals in Table I the necessary sample sizes were determined and entered in a table similar to Table II. This total was then apportioned among the eleven regions using the same percentages as found in Table I.

A comparison of information previously collected showed a census available for twenty-five programs. These programs are reported in the maps as census information. It was necessary for more information to be collected in most of the remaining sixty-nine occupational objectives. This follow up survey was conducted by telephone. A sufficient sample was obtained for sixty-three of the remaining occupational objectives. Six occupational objectives, all from Distributive Education, were eliminated because of insufficient response levels.

Method of Data Analysis

As the teacher reply forms were returned and the follow up information was taken by telephone, the information was coded to show the sub-state planning region, in which the graduate was reported to be either working or seeking work. Additionally, the students who left the state for employment were coded according to the state to which they migrated.

Although the information was not requested, many teachers indicated that the graduate was in the military. If the exact location of the graduate was not known, or if the graduate was out of the country, a separate code was developed so that a percentage was reported for graduates in the military.

All of the information collected was then punched on data cards to be used in a Statistical Analysis System (SAS) computer program. The SAS was used to determine, for each occupational objective, the percentage of sample graduates who were trained in each of the eleven sub-state planning regions and the percentage who were working or seeking work in each of the regions.

A second application of SAS was used to determine, for each occupational objective in each sub-state planning region, the percentage of sample graduates of that region who were working or seeking work in each of the other regions, out of state, or were unknown.

Summary of Findings

A chi square test was used to determine (for each occupational objective) if the distribution of trainees to the eleven sub-state planning regions was significantly different from the distribution of graduates to the eleven sub-state planning regions. In twenty-four of the eighty-eight occupational objectives, a significant difference at the .05 level was indicated. Higher education dominates training in thirteen of the twenty-four statistically significant occupational objectives. This fact may partially explain why these particular objectives are statistically significant.

The higher education institutions are not easily labeled as either commuter or residential, nor can it be said that an institution serves one particular area. The question of what constitutes mobility must be asked. If a student leaves the home sub-state planning region to receive vocational technical training at a higher education institution in another region, and upon completion of the training returns to the home region, has there been geographic mobility?

This phenomena may be illustrated by isolating one class for the Oklahoma School of Technical Training at Okmulgee. There were twenty graduates in Upholstery I in the population. Fifteen of these graduates (75 percent) returned to their home regions to work. In this particular case, five of the fifteen were from other regions, so they were reported as having moved from sub state planning region 2 to their region of origin. This is only an isolated example and is not statistically significant, but does illustrate a problem peculiar to the higher education programs.

A second and similar problem occurs in reference to the Area Vocational-Technical Schools. None of these schools are residential, but ten of the twenty-one area schools draw students from more than one sub state planning region. Two of the area schools even have training sites in two separate regions. This becomes a particular problem since Central Oklahoma Area Vocational Technical School at Drumright is the dominant training institution for two of the statistically significant occupational objectives. At the time of the survey, the Central Oklahoma Area Vocational Technical School encompassed school districts in three sub state planning regions 5, 6, and 8. The school site at Drumright is in region 6, but within a few miles of region 5.

Occupational Objective 179901, Truck Driver, provides an interesting example of this problem. The only truck driver training program in Oklahoma is at Central Oklahoma Area Vocational Technical School at Drumright. There are some students in Cooperative Vocational Education classes who have Truck Driver as an occupational objective, however, the Drumright site accounts for 82.6 percent of the total Truck Driver graduates. The survey shows that 21.0 percent of the graduates migrated to region 5, 18.4 percent stayed in region 6, and 2.6 percent migrated to region 8. It is not known how many of these students actually moved.

The basic premise of the mobility study was to measure movement from the training site. The mobility study was not an attempt to explain or analyze the causes of moves. However, the reader should be aware of the two previously mentioned problems while interpreting the information presented in the maps.

Use Of The Maps

The results of the mobility study are best presented in maps. The maps provide information based on the eleven sub state planning regions. Appendix I provides the reader with a map showing the counties in each sub-state planning region.

There is a Trained and Working map for each of the eighty-eight occupational objectives included in the survey. For twenty of the twenty four occupational objectives which were found to have statistically significant mobility, there is a second map which illustrates the mobility of graduates.

The Trained and Working map presents two categories of information, both of which are expressed as percentages. The "trained" number for each region is the percentage of the total number of graduates that were trained in that region. "Working" represents the percentage of total graduates that is working in other states, including the percentage that is in the military. "Unknown" indicates the percentage for which the teacher could not provide information regarding location.

The Mobility maps are expressed in state-wide percentages as are the Trained and Working maps. The map shows the direction and level of geographic mobility of the graduates. Migration out of each region is shown by a line which leads from the number of the region of origin to just inside the boundary of the region of destination. The number at the end of this line represents the percentage of total graduates (state-wide) that followed that migration path. Out of state migration is similarly reported, except that the migration path is drawn to the nearest state border rather than the state-of-destination. In all cases, both in state and out of state, an effort was made to construct the map with as little confusion as possible.

An Example

Occupational objective 40700, Food Services, will be used as an example. Reference to the Trained and Working map for Food Service shows that there was a total of 106 graduates in 1973-74, sixty nine of these graduates were included in the sample.

Observation of the "trained" information shows that 8.7 percent of the state's graduates were trained in region 1. Region 8 trained 37.7 percent of the graduates, while there was no training in region 11.

The "working" information shows that 5.8 percent of the graduates are working or seeking work in region 1. Region 8 shows 34.8 percent working. Kansas has accepted as in-migrants 1.5 percent of Food Services graduates, while 2.9 percent each are in the military and unknown.

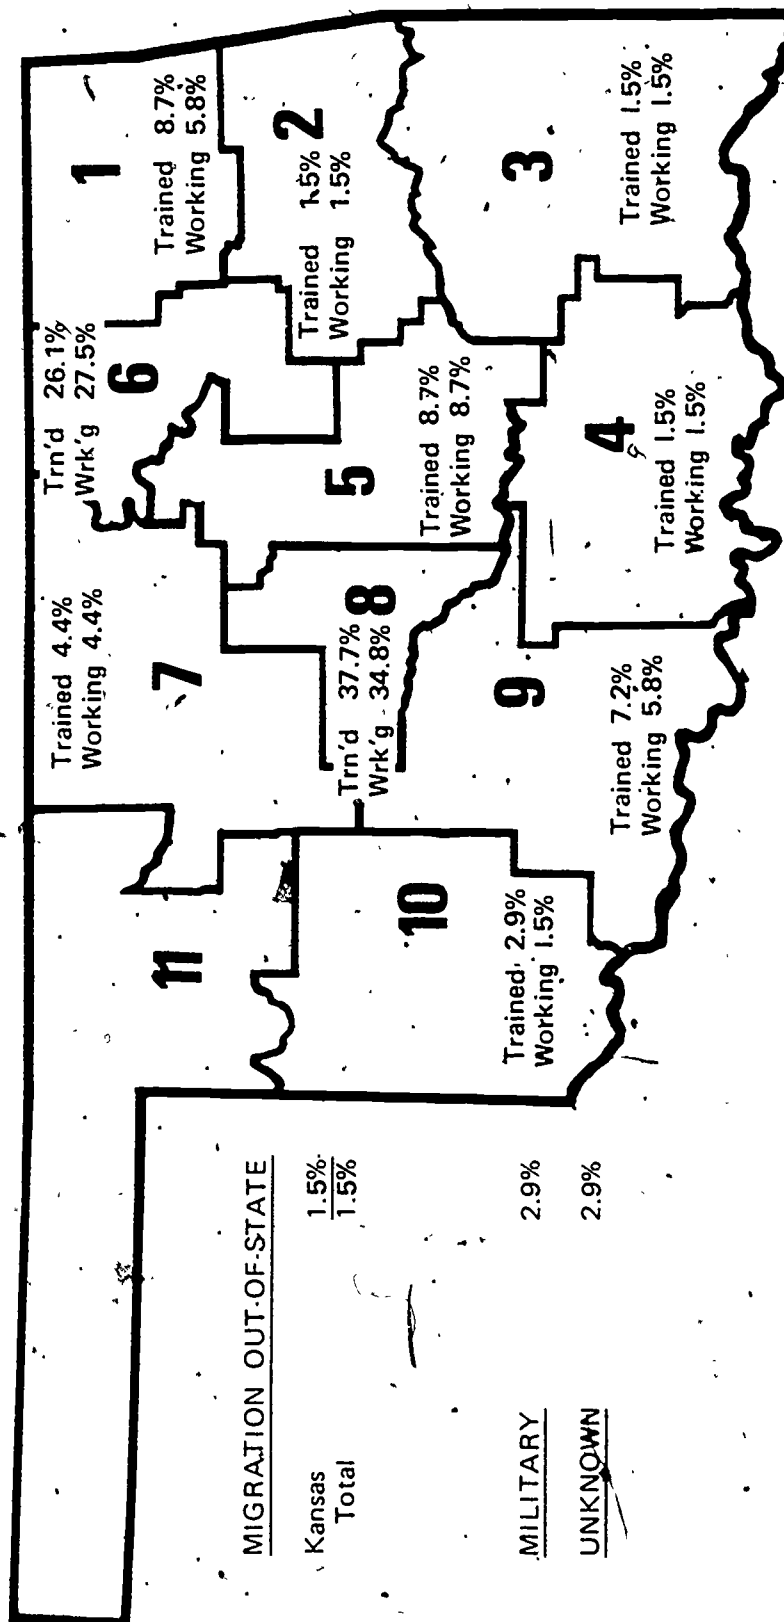

Although Food Services did not show statistically significant mobility, a Mobility map has been prepared for purposes of this example. An examination of region 1 reveals that 1.5 percent of the graduates migrated from region 1 to region 6 and another 1.5 percent to region 8. This 3.0 percent out migration completely accounts for the difference between the 8.7 percent trained and 5.8 percent working, observed in the Trained and Working map. (The percentages shown in the maps have been rounded to the nearest tenth.)

TRAINED AND WORKING

Occupational Objective Number: 040700 Occupational Title: Food Service
 Total Trained in Oklahoma: 69 Sample Size: 106

TRAINED ... This number represents the percentage of state graduates
 that graduated from training sites in each region.

WORKING ... This number represents the percentage of state graduates

MIGRATION OUT-OF-STATE

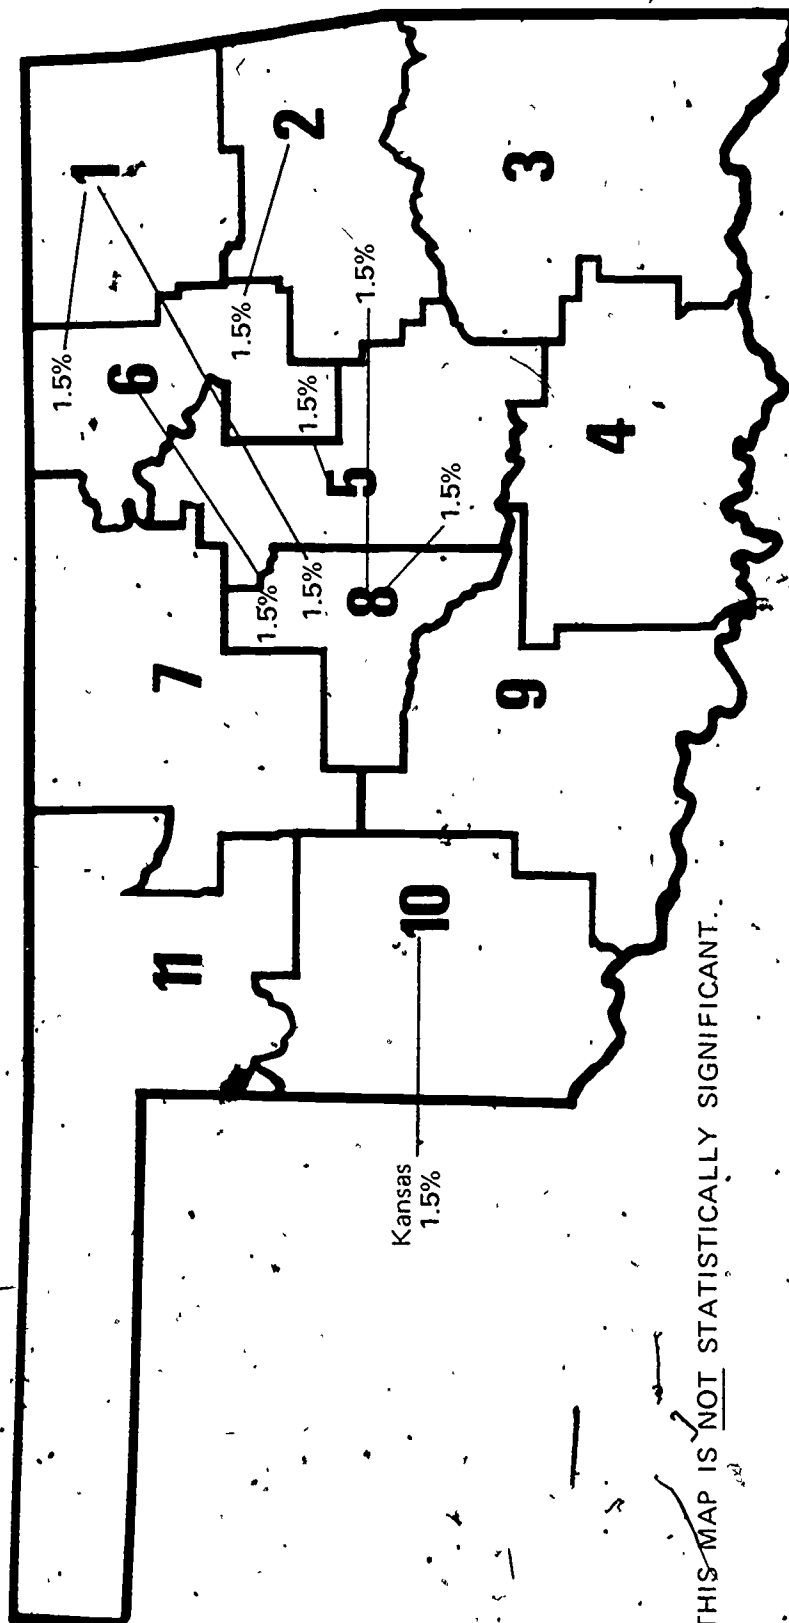

Kansas 1.5%
 Total 1.5%

MILITARY 2.9%

UNKNOWN 2.9%

MOBILITY

Occupational Objective Number: 040700 Occupational Title: Food Service
Total Trained in Oklahoma: 106 Sample Size: 69

THIS MAP IS NOT STATISTICALLY SIGNIFICANT.

Further examination of the map shows that 15 percent of the graduates followed a migration path from region 10 to Kansas. Again, the map is drawn for convenience and simplicity. In all cases the shortest route out-of-state is followed, regardless of what state is the destination.

It should be seen by comparing both maps that region 9 has shown no out migration. However, region 9 does have a 1.5 percent decrease from trained to working as shown by the 5.8 percent of graduates that are working in region 9, compared to the 7.2 percent "trained" on the Trained and Working map. This loss is accounted for by the factors of unknown and military.

Presentation Of The Results

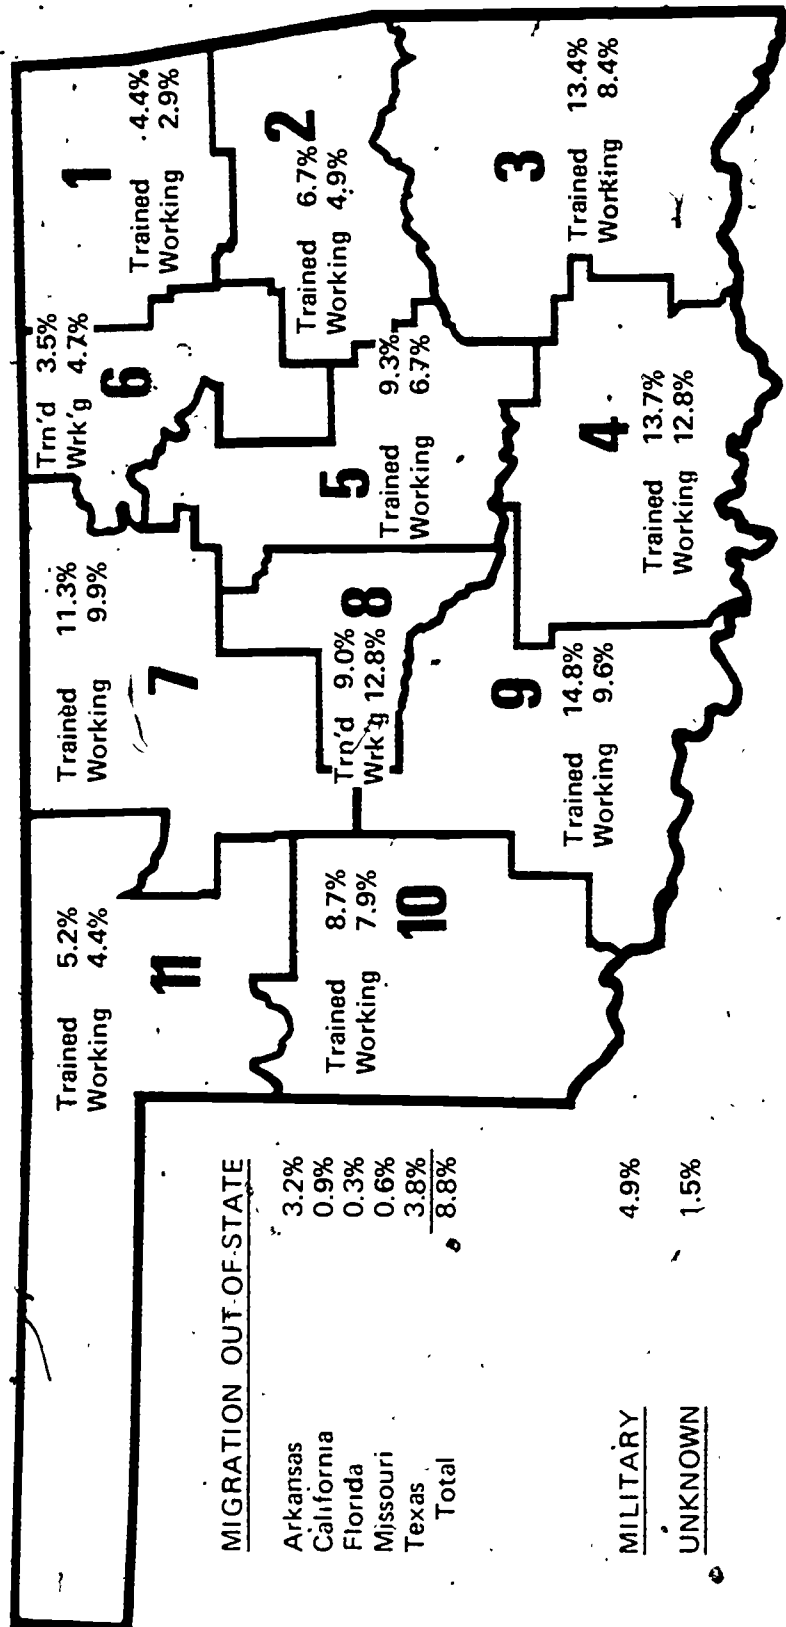

The results of the study are presented in the following maps. The maps are presented in numerical order by occupational objectives. The twenty-four occupational objectives which had statistically significant mobility are included in order with the others, twenty are followed by the second map showing mobility. The remaining four occupational objectives which had statistically significant mobility had only one training site each. This made the Mobility map unnecessary since it is obvious where the graduates went by observing the Trained and Working map. These occupational objectives will be identified as statistically significant of the Trained and Working map.
